

Port Container Lifting Spreader

◆ Basic Parameter:

Capacity 5-40T

Usage Lifting

Name: Container Spreader

Applications:

The main frame of container lifting equipment has high strength, good rigidity, and light self weight. The main beam of the lifting device is made of I-beam, and strengthened at the four key lifting points and cantilevers, thereby enhancing the bearing capacity and rigidity of the lifting device.

The rotary lock adopts a dual positioning device, which prevents the lifting device from rotating when lifting the container, enhancing safety performance. The horizontal transmission rod of the lifting device adopts a four link mechanism, which makes the rotation of the rotary lock smoother and more accurate, thereby further improving the safety of loading and unloading operations.
